What is Amazon?

The Amazon app is a mobile e-commerce platform that enables users to browse and **purchase** products, **manage** deliveries, and **access** digital services like video, music, and subscriptions.

Why Amazon?

The world's most visited shopping platform — *with room to improve*

- **300+ million active customers** globally, making it one of the most used apps in daily life — from groceries to electronics to everyday essentials
- Its scale means even small UX improvements have outsized real-world impact; a better experience for millions, not just a design exercise
- Amazon's own data shows **35% of its revenue comes from product recommendations** alone — the interface is directly tied to business outcomes, making it the ideal candidate for a research-first redesign

Problem Statement

Information overload at the moment of decision

Amazon's current app experience **lacks clarity and organization**, leading to cognitive overload and user confusion.

- Shared accounts **mix activity across users**, creating a cluttered interface
- Product pages surface **too much at once** (long titles, pricing stacks, ads), reducing decision clarity
- Recommendations **lack transparency**, making users question relevance and trust

Research

Sample Statistics

Sample Size = 80 participants (within 3 - 4 days)

About 20% of participants entered their email to see our redesigned concept

80% of participants were between 18-21 years old, and in college. The lowest age was 17 and the highest was 51.

Research

*Opinions split almost in-between with results, expressing there is **tension among the users and the interface(s)**.*

Have you ever experienced confusion or frustration while using Amazon?

80 responses

Research

*2/5 of the sample state that they find orders from Amazon that **do not belong to them**.*

If yes, how often do you see orders that are not yours?

65 responses

Research

Majority voted that information in the app is complete but **needs effort to find**

Which best describes your experience with product information on Amazon pages?

80 responses

- Information is clear and well-prioritized
- Information is complete but requires effort to find
- Information feels overwhelming
- Option 4 Information feels insufficient
- Not sure

Research

About half of the sample find that a clear UX would be **moderately helpful**.

How helpful would a clearer visual hierarchy that highlights key product details earlier on the page be?

Amazon Design Research Information

Amazon prioritizes behavioral data over modern design trends.

UI uses aggressive categorization, mega-menus, and faceted search filters to narrow down the user's focus instantly.

High-contrast colors, minimizing the physical and mental effort required to make a purchase. (*The Else Inc. UX Agency*)

Placing the star rating immediately below the product title establishes baseline credibility before the user even reads the price or description.

Sections dedicated to customer Q&As and photo reviews are treated as primary content blocks, actively reducing purchase anxiety (*UX Analysis by Kirtika Srivastava*)

"I want to focus on the products I am buying, without fighting with a clunky interface."

Goals

- Quickly compare products before buying
- Navigate product pages without excessive scrolling, saving time while shopping online
- Easily find key details like price, reviews, and images
- Simpler and more organized shopping experience, navigate past purchases quickly

Core Needs

- Clear, visibility of price, reviews and images
- Organized product information will have a clear visual hierarchy
- Quick summaries of product highlights
- Cleaner product pages with less clutter

Pain Points

- Product pages feel overwhelming with too much information
- Important details like price, reviews, and key features are hard to find quickly
- Difficult to compare similar products efficiently
- Too much scrolling is required to locate relevant product information
- Confusion when orders appear from other user on shared accounts

Needs & Expectations

- Clear, visibility of price, reviews and images
- Organized product information will have a clear visual hierarchy
- Quick summaries of product highlights
- Cleaner product pages with less clutter

Title Restructure

Separating identity from SEO

Current titles are written for algorithms — cramming brand, features, and keywords into one unreadable sentence

Redesign splits it into a short display title, scannable feature chips, and a quiet compatibility footnote — cleaner for users, SEO untouched

Lo-Fi Wireframes

Price Card

Progressive Disclosure - Show what matters first

Current price zone stacks 6+ elements at once: price, savings, coupon, delivery, seller; all competing for attention

Redesign collapses this into a two-layer card: key info upfront, everything else one tap away

Orders

Finding your orders shouldn't require a search

Amazon's current orders page mixes all account orders together with no clear ownership — confusing on shared accounts, and hard to filter quickly

Redesign introduces a dedicated search bar, filter controls (by order type and date), and groups orders by delivery date under clear "Upcoming Orders" headers — so the most time-sensitive information surfaces first

Profile Switcher

Shared accounts, personal order history

On shared Amazon accounts (families, households), orders from different users appear in the same list with no way to distinguish who ordered what

A "Who's shopping?" bottom sheet lets users switch between named profiles before browsing — keeping each person's orders, recommendations, and history cleanly separated without needing separate accounts

Prototype

Design Challenges

Couldn't stray off from the original Amazon interface as we were improving it.

Inhibit consumers from using the platform.

Amazon's whole interface was simple and functional but relies more on business and conversion rates.

Reflection

While working on this project, we learned how to navigate and use Figma effectively. At first, some of us struggled to understand the design features and the interface, as they were new and somewhat confusing. However, over time, we gradually became more comfortable using the tools and began to understand how to create layouts, organize components, and design user interfaces more efficiently. This experience helped us improve our design skills and gain confidence in using Figma for future projects.

We also discovered how important prototyping is in app design. Since prototyping brings the app to life, it is just as important to implement it in Figma.

THANK YOU!
